

Performance Problems

Got You in the Rough?

Get a *clear view*
of your WebSphere®
application *performance*.

Corporate application infrastructure varies from customer to customer. The impact of such variable environments on the performance of your IBM® WebSphere application can be difficult to predict—and the resulting problems can put you deep in the rough.

Altworks Panorama spares you—and your customers—the high costs of a poorly performing WebSphere application. It enables you to see your application as a system and provides you with detailed, end-to-end visibility into your entire Web enterprise. For ISVs, this translates into the valuable ability to pinpoint performance problems—reliably and easily—when you're integrating your application into each unique customer environment.

Panorama monitors and captures thousands of discrete metrics across multiple tiers of the application infrastructure. It distills and correlates key metrics down to the system resource and method levels, and automates the identification of the dependencies of poor performance. As a result, you'll be able to focus the appropriate resources on fixing the problems, reducing costly troubleshooting and shortening your release cycles.

Get out of the rough. Optimize your WebSphere application performance and ensure customer satisfaction with Altworks Panorama.
